

Splash Values error

Posted by Carie Deatherage - 2009/11/09 18:52

When I attempt to "Write input files for KINEROS" I get the error "The splash value for watershed (##) was below 0.001 which may indicate a problem with the parameterization. This value has been changed to 0.001 in the Kineros Parameter file to prevent the model from crashing."

This error message appears for about 20 watersheds. In the attribute table the splash value just appears as 0.

Any suggestions?

Thanks,

I think this problem got fixed by downloading the KINEROS2_AGWA.exe and placing it in the models folder. That seemed to make the splash errors go away. Plus then I realized that I needed to change the Discretizer %area from 2.5 to 5 because I had some really small sub-watersheds.
